You can’t shortcut understanding.

8Examples / think it through

You can’t shortcut understanding.

Digital products, websites, and AI workers built from concrete examples, clear timelines, and working proof.

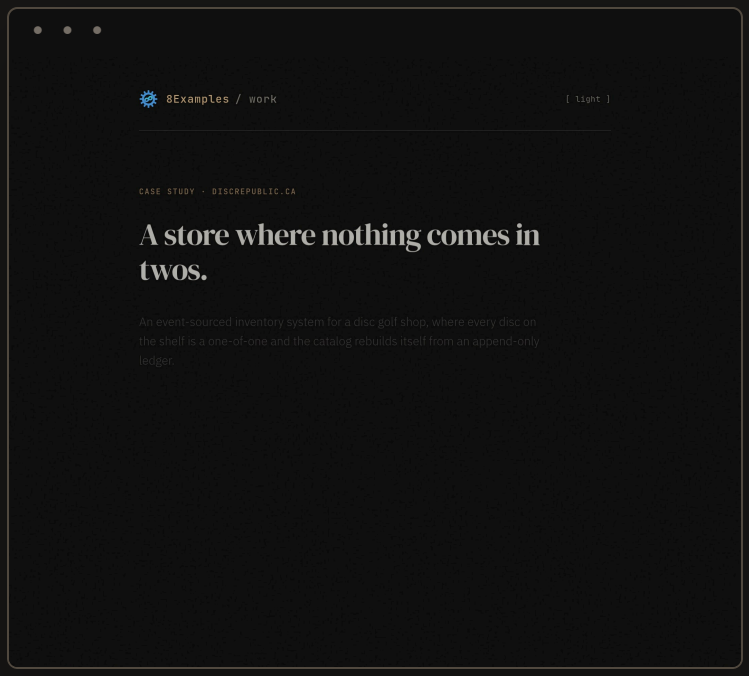
8EXAMPLES.COM

THE DISCIPLINE

Understand it before you build it.

The expression is the discovery. We walk through the real behaviour, step by step, until everyone can point at the same thing.

That work can be a one-page website, an autonomous migration loop, or an AI worker answering a customer. The scale changes. The habit does not.



01

Is it worth it?

Run the cheapest credible test before committing to the full build.

02

What is it?

Define the product through examples: given this, when that, then this happens.

03

What happens?

Lay out commands, events, and views over time so the whole system is visible.

04

Can we prove it?

Build the tests and feedback loops that make the claim measurable.

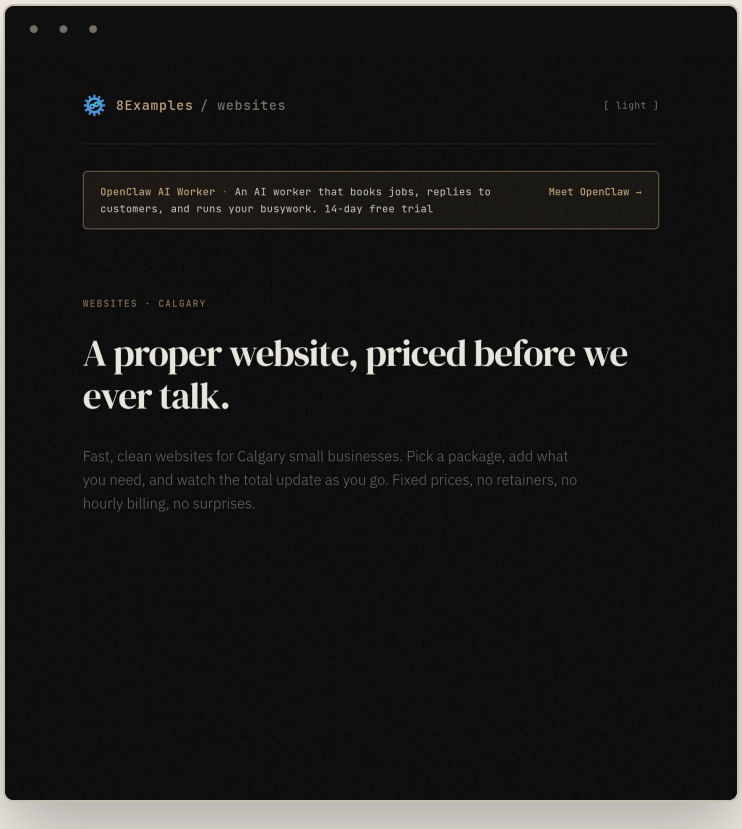
05

Can it stay simple?

Prefer small, inspectable systems that are cheap to run and easy to change.

WEBSITES FOR CALGARY SMALL BUSINESS

A proper website, priced before we ever talk.



Fixed prices. No retainers. No hourly billing. No surprises.

Every package includes a free custom domain for the first year and a real email address at that domain. Sites are designed for phones first, with direct contact and clear local search basics.

Starter Site

$197

One page, done right. Live within a week.

Business Site

$1,499

Up to five pages with room for each service.

Pro Site

$2,999

Up to ten pages, forms, analytics, and deeper search work.

Site Refresh

from $599

Keep your content and ranking. Modernize the experience.

Useful additions: Canadian hosting, business email, Google Business Profile, care plans, and an AI assistant for your site.

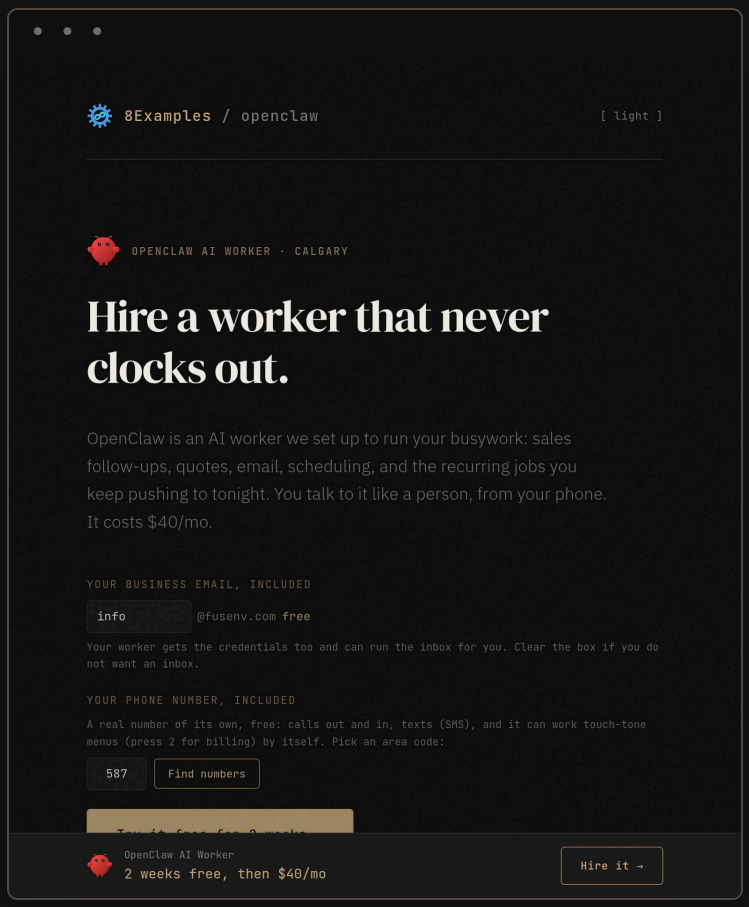
OPENCLAW AI WORKER

A full-time worker for $40 a month.



We set it up, host it in Canada, and give it the channels it needs. Afterwards, running it is as simple as sending a message.

14-DAY FREE TRIAL

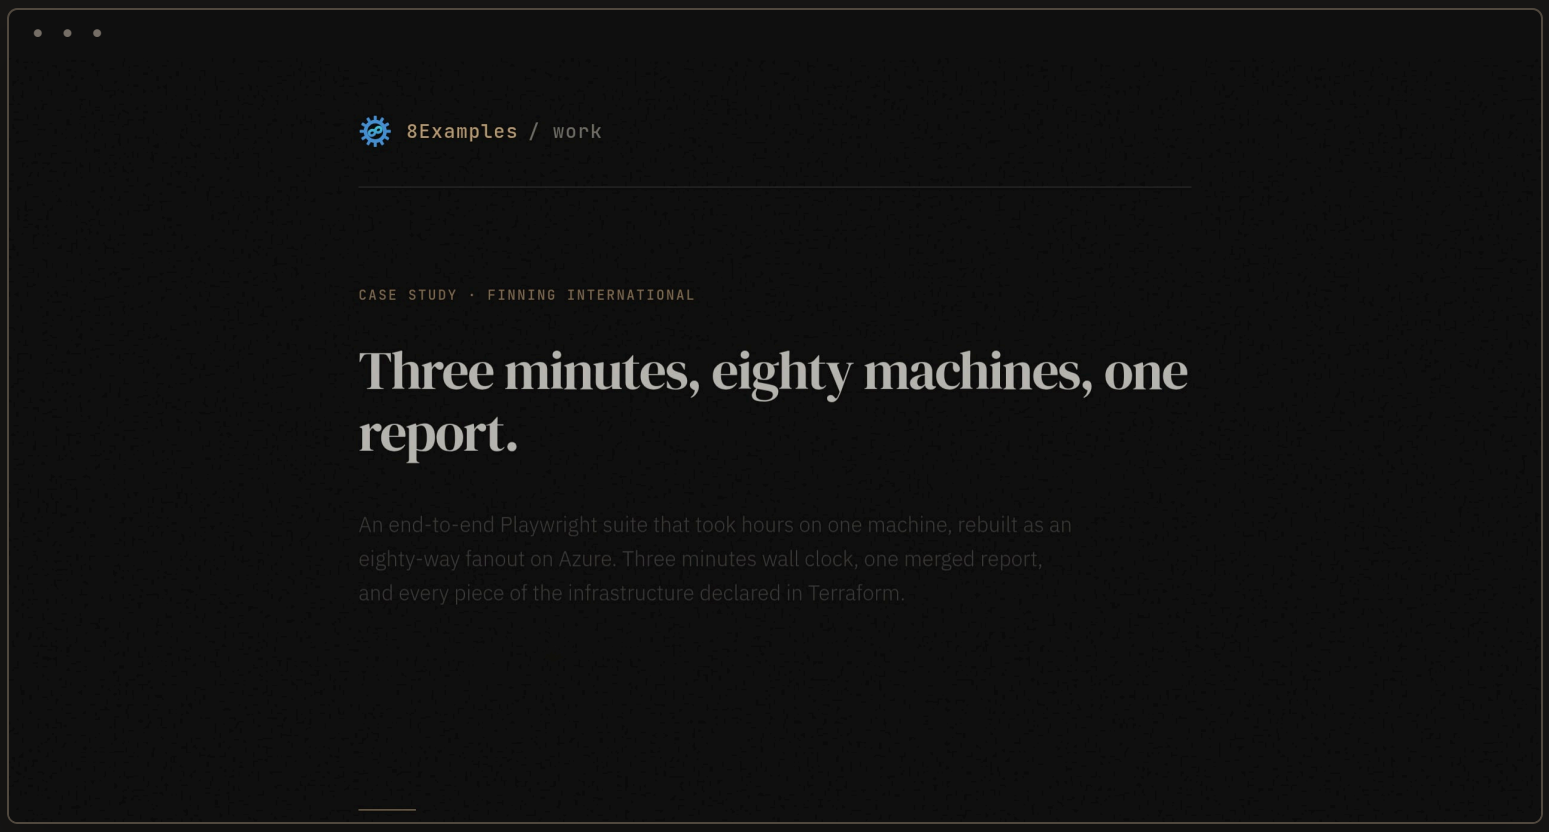
A well-known open source AI assistant, configured to work for your business.

- \+ Works sales leads and follows up
- \+ Drafts quotes, invoices, and documents
- \+ Reads and answers its own email
- \+ Keeps a calendar and books appointments
- \+ Runs recurring jobs on schedule
- \+ Uses chat, email, and its own phone number

No setup fee. No contract. Cancel anytime.

MEET YOUR WORKER AT 8EXAMPLES.COM/OPENCLAW →

Three minutes, eighty machines, one report.



80×	3 min	20→80%
parallel test replicas	wall-clock runtime	use-case coverage

The problem. An end-to-end Playwright suite took hours on one machine, so it ran at night and teams rationed coverage.

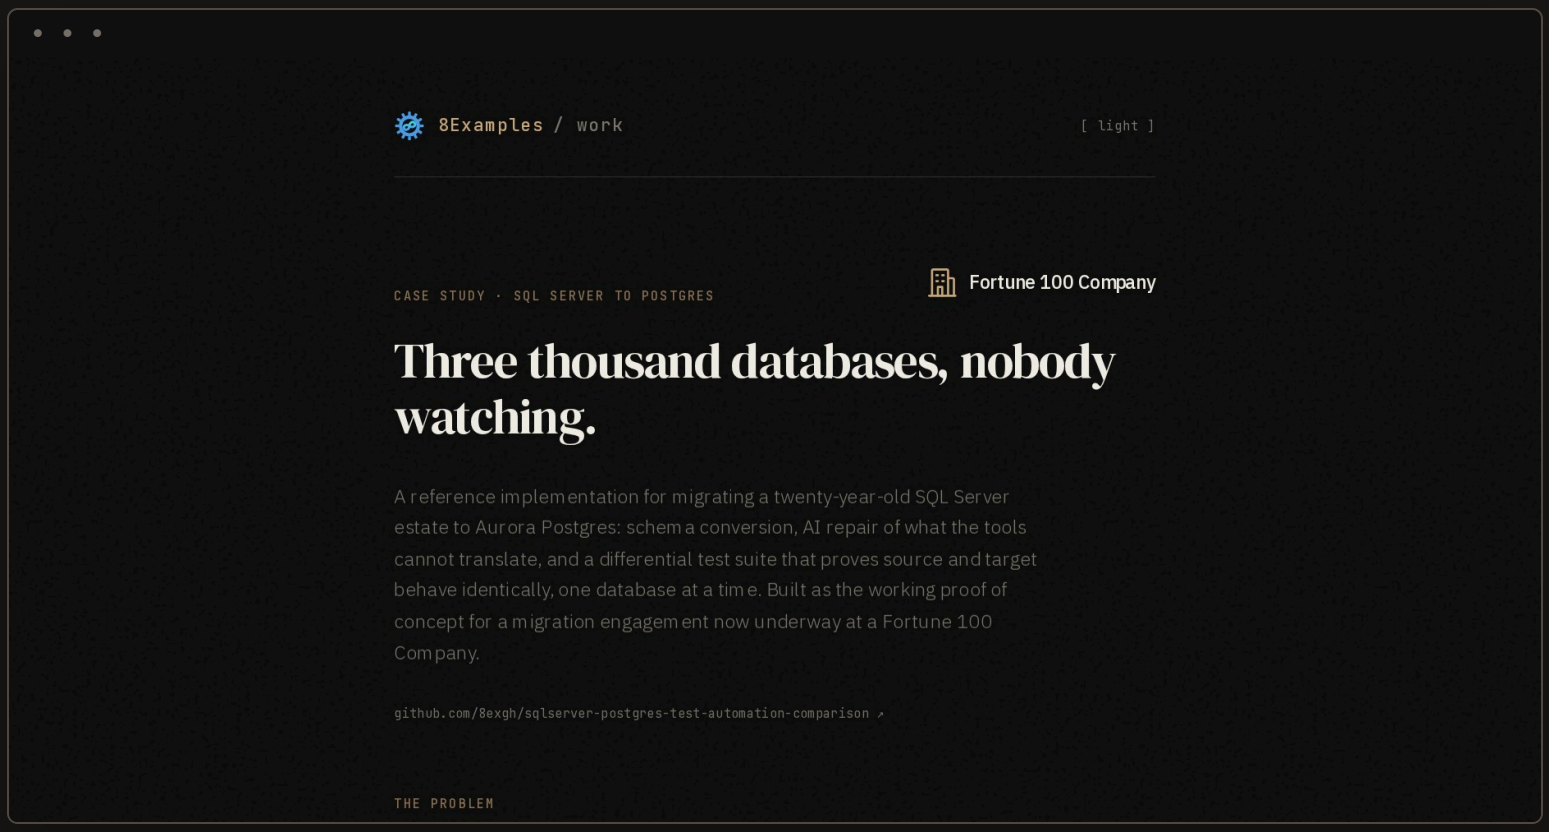
The move. We walked the timeline of eighty replicas starting together, then built a sharded fanout on Azure Container App Jobs. A small function distributes shard numbers through a blob lease, while every replica reports its result.

READ THE FULL CASE STUDY →

The result. The suite completes in about three minutes. Coverage grew because fast tests stopped being a scarce resource. The whole environment lives in Terraform, with no pet servers to maintain.

CASE STUDY / SQL SERVER TO POSTGRES

Three thousand databases, nobody watching.



3,000
databases in the estate

20 years
of procedures and triggers

1 gate
differential proof of behaviour

The problem. Tables are the easy part. Behaviour buried in stored procedures and triggers is where a migration can quietly change the business.

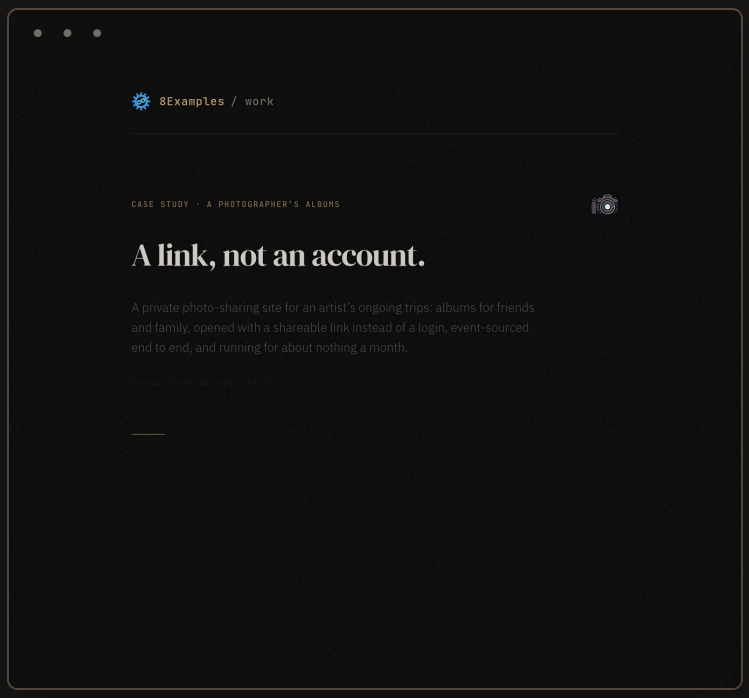
The move. Convert the schema, let AI repair what conventional tools cannot translate, then run the same inputs against source and target. Compare outputs and side effects, repair, and repeat.

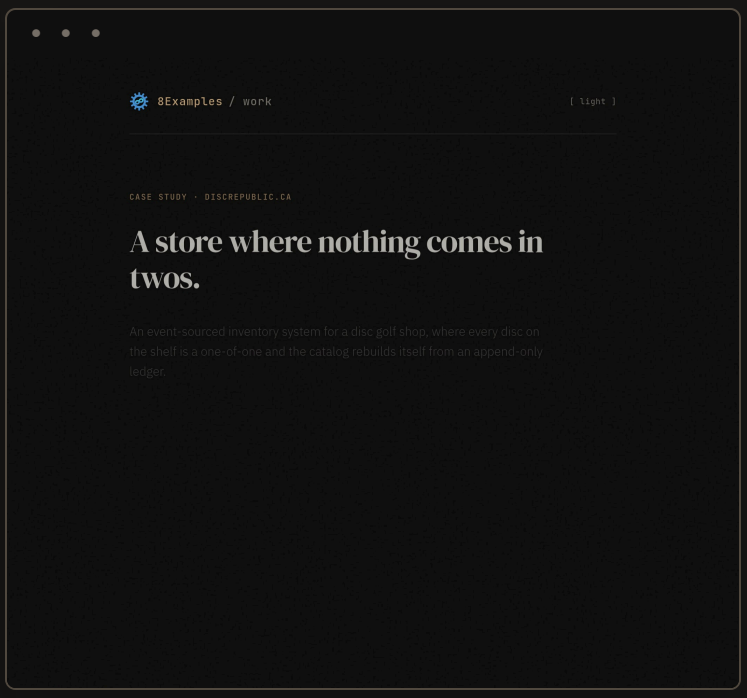
READ THE FULL CASE STUDY →

The result. An autonomous loop earns the right to continue only when a differential test suite proves equivalence. The proof of concept is now behind a migration engagement underway at a Fortune 100 Company.

SELECTED WORK

Small systems. Concrete rules. Real outcomes.





A store where nothing comes in twos.

DiscRepublic's one-of-one inventory is driven by an append-only ledger and two patient background jobs. Shopify assembles itself from the facts.

A link, not an account.

Private family photo albums with one admin password, shareable guest links, and a single SQLite ledger on one small server.

Ink arrives as a webhook.

DocuSign callbacks become facts in a property-management ledger. Retries, duplicates, and out-of-order messages become non-events.

Share the file, skip the account.

One admin uploads. Everyone else clicks an unguessable link. Files expire automatically and the whole path is tested on every push.

Bring the complicated thing.

A new product, a stubborn workflow, a website that needs to earn its keep, or an AI worker with a real job to do. We'll walk through it concretely, then build what the examples prove.
